Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

PERSONA NAME: IT Service Desk Agent (L1 Support)

SAYS

Says: "I spend more time categorizing tickets than actually solving them."

Says: "Half the tickets assigned to our queue don't even belong to us."

Says: "We need a smarter system to sort these automatically."

THINKS

Thinks: "There must be a better way to handle this volume of tickets."

Thinks: "If only the system could learn from past tickets and auto-classify new ones."

Thinks: "I worry about misrouting high-priority tickets and missing SLAs."

DOES

Does: Manually reads each ticket short description and additional comments.

Does: Looks up past similar tickets to determine correct category and assignment group.

Does: Spends 3-5 minutes per ticket on classification before starting resolution.

FEELS

Feels: Overwhelmed during peak hours (Monday mornings, post-deployment windows).

Feels: Frustrated by repetitive, low-value classification work.

Feels: Anxious about making classification errors that lead to SLA breaches.
