Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem-Solution Fit

This document validates that the proposed solution directly addresses the identified problems. It maps each customer problem to a specific solution feature, ensuring alignment between user pain points and the system capabilities being built.

S.No	Customer Problem	Proposed Solution Feature	How It Solves the Problem	Expected Outcome
1	IT agents spend 3-5 min per ticket on manual classification (category, subcategory, priority).	Predictive Intelligence auto-classification triggered via Flow Designer.	ML model analyzes the short description and auto-assigns category, subcategory, and priority within seconds of ticket creation.	80% reduction in classification time; agents focus on resolution.
2	22% of tickets are misrouted to incorrect assignment groups, causing delays.	Flow Designer auto-routing subflow with confidence-based assignment.	After classification, Flow Designer maps the predicted category to the correct resolver group using assignment rules.	Misrouting rate drops to < 5%; faster MTTR.
3	SLA breaches due to delayed ticket routing, especially for P1/P2 incidents.	Real-time classification with priority-based escalation flows.	High-priority tickets are classified and routed instantly; escalation flows trigger for P1/P2 within minutes.	30% improvement in SLA compliance.
4	No visibility into classification accuracy or ticket routing patterns.	Performance Analytics dashboard with classification KPIs.	Dashboard shows real-time accuracy, confidence scores, volume trends, and misrouting statistics.	Data-driven decisions for process improvement.
5	New agents lack experience to correctly classify complex tickets.	Confidence score display with manual override fallback.	Low-confidence predictions (<80%) are flagged for manual review; agent corrections retrain the model.	Consistent quality regardless of agent experience.
