Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Code-Layout, Readability and Reusability

This document evaluates the code organization, readability standards, and reusability practices followed during the development of the Auto Ticket Classification system.

1. Code Layout & Organization

S.No	Component	Type	Description
1	Auto Classify Incident	Flow Designer - Main Flow	Primary orchestration flow triggered on incident creation. Calls subflows sequentially.
2	Get PI Prediction	Flow Designer - Subflow	Invokes Predictive Intelligence API, retrieves category prediction and confidence score.
3	Route to Assignment Group	Flow Designer - Subflow	Maps predicted category to assignment group using lookup table. Reusable across flows.
4	Handle Low Confidence	Flow Designer - Subflow	Routes low-confidence tickets to manual triage queue with work notes.
5	ClassificationUtils	Script Include	Reusable server-side JavaScript utility class for classification helper functions.
6	AutoClassifyBR	Business Rule	Before-insert business rule that triggers the main Flow Designer flow.
7	ConfidenceScoreWidget	Service Portal Widget	Angular-based widget displaying prediction confidence on the incident form.
8	ClassificationDashboard	PA Dashboard	Performance Analytics dashboard with classification KPIs and trends.

2. Readability Standards

- Naming Convention: All flows, subflows, and script includes follow descriptive naming (e.g., 'Auto Classify Incident', 'ClassificationUtils')
- Comments: All Script Includes and Business Rules include JSDoc-style comments explaining purpose, parameters, and return values
- Flow Documentation: Each Flow Designer step has a description annotation explaining its purpose and expected inputs/outputs
- Variable Naming: camelCase for JavaScript variables, descriptive names for flow variables (e.g., 'predictedCategory', 'confidenceScore', 'targetAssignmentGroup')

3. Reusability Practices

- Subflows designed as independent, reusable units that can be called from any flow
- ClassificationUtils Script Include is a reusable utility class callable from any server script
- Flow Designer Actions encapsulate atomic operations for reuse across multiple flows
- Update Sets package all components for deployment across instances (Dev/Test/Prod)
- Configuration parameters stored in System Properties for easy modification without code changes
