Auto Ticket Classification using Flow Designer - Project Documentation

A comprehensive guide to the Auto Ticket Classification system on ServiceNow.

1. Introduction

1.1 Purpose:
This document provides complete documentation for the Auto Ticket Classification system built on the ServiceNow platform. The system automates the classification and routing of IT incident tickets using Predictive Intelligence (ML) and Flow Designer.

1.2 Scope:
The system covers automatic classification of incidents created via Service Portal, email, or API. It assigns Category, Subcategory, Priority, and Assignment Group to incoming tickets with minimal human intervention.

1.3 Audience:
- ServiceNow Administrators
- IT Service Desk Managers
- L1/L2 Support Agents
- Project Evaluators

2. System Requirements

- ServiceNow Instance: Xanadu release or later
- Plugins Required:
  * Predictive Intelligence (com.glide.platform_ml)
  * Flow Designer (com.glide.hub.flow_designer)
  * Performance Analytics (com.snc.pa)
  * Agent Workspace (sn_agent_workspace)
- Minimum Data: 5,000+ historical incident records for model training
- Roles: admin (setup), itil (agent usage), pa_viewer (dashboard)

3. Installation & Setup Guide

Step 1: Import Update Set
  - Navigate to System Update Sets > Retrieved Update Sets
  - Import 'Auto_Classify_v1.0.xml'
  - Preview and Commit the update set

Step 2: Configure Predictive Intelligence
- Navigate to Predictive Intelligence > Solutions
- Open 'Incident Classification' solution
- Verify training data filter (12 months of closed incidents)
- Click 'Train' to build the ML model
- Wait for training completion (typically 15-30 minutes)

Step 3: Activate Flow Designer Flows
- Navigate to Flow Designer
- Open 'Auto Classify Incident' flow
- Click 'Activate' to enable the flow
- Verify trigger condition is set correctly

Step 4: Configure System Properties
- x_auto_classify.confidence_threshold = 0.80
- x_auto_classify.default_group = [fallback group sys_id]
- x_auto_classify.enable_email_classification = true

Step 5: Enable Scheduled Retraining
- Navigate to System Definition > Scheduled Jobs
- Activate 'PI Weekly Retrain' scheduled job
- Set preferred schedule (default: Sunday 2:00 AM)

4. User Guide

4.1 For End Users:
- Submit incidents normally via Service Portal
- The system auto-classifies in the background
- You'll receive a notification when your ticket is assigned

4.2 For IT Agents:
- Auto-classified tickets appear in your assignment group queue
- Check the Confidence Score field to see prediction accuracy
- If the classification is incorrect, use the 'Override Classification' button
- Your corrections improve the model during next retraining cycle

4.3 For Administrators:
- Monitor classification accuracy via the PA Dashboard
- Adjust confidence threshold via System Properties
- Manage category-to-group mappings in the mapping table
- Review audit logs for compliance reporting

5. Troubleshooting

Issue 1: Tickets not being auto-classified
- Check: Is the Flow Designer flow activated?

- Check: Is the Business Rule 'AutoClassifyTrigger' active?
- Check: Does the incident have a non-empty short description?

Issue 2: Low classification accuracy
- Check: Is the training data sufficient (>5,000 records)?
- Check: When was the model last retrained?
- Action: Manually trigger retraining with latest data

Issue 3: All tickets going to manual triage
- Check: Confidence threshold may be set too high
- Action: Lower threshold from 0.80 to 0.70 if needed
